fibrosis is a chronic and progressive lung disease that causes scar tissue between the walls of the lungs where the air sacs are located. (1,2) As this scar tissue starts to thicken and stiffens, your lungs become unable to take in oxygen in an efficient manner, and you find it difficult to breathe. (3,4) Being a progressive disease, idiopathic

Causes and Risk Factors

Idiopathic pulmonary fibrosis (IPF) is the most severe form of chronic

lung fibrosis. It is unclear how monocytes

contribute to fibrosis in IPF. Here, we show that

levels of circulating monocytes correlated

directly with the extent of fibrosis in IPF lungs, as measured by CT

imaging. IPF monocytes
