Fire is the rapid oxidation of a material in the exothermic chemical process of combustion, releasing heat, light, and various reaction products. Fire is hot because the conversion of the weak double bond in molecular oxygen, O 2, to the stronger bonds in the combustion products carbon dioxide and water releases energy (418 kJ per 32 g of O 2); the bond energies of the fuel play only a minor ...

Latest California Wildfire News Updates | The Sacramento Bee
Active Fire Data. There are two major types of current fire information: fire perimeter and hot spot data: Fire perimeter data are generally collected by a combination of aerial sensors and on-the-ground information. These data are used to make highly accurate perimeter maps for firefighters and other emergency personnel, but are generally updated only once every 12 hours.
