This title is a much needed update of Barbosa's self-published Manual of Basic Techniques in Insect Histology. It is a laboratory manual of 'traditional' and 'modern' insect histology techniques, completely revised using cutting-edge methodology carried out today and includes new immunohistochemical techniques not previously looked at. Insect Histology is designed as a resource for student and professional researchers, in academia and industry, who require basic information on the procedures that are essential for the histological display of the tissues of insects and related organisms.

A new edition of the standard text-reference covering the full range of histological techniques used in medical laboratories and pathology departments. Written for histotechnologists in training and in practice, the book provides a thorough grounding in all aspects of histological technology, from basic methods of section preparation and staining to advanced diagnostic techniques such as immunohistochemistry and cytology. The book provides a balance between the new and the older techniques and is a suitable resource for both the beginner in histotechnology and for the fully qualified laboratory technician.

'Eyw rpwvry -OiwTO- EV Tti E()rllup JOHN, J. 23 A SURVEY OF THE PRINCIPAL WORKS on histological technique that have th appeared since the end of the 19 century shows such a diversity of concept and directive ideas, in spite of the fundamental unity of subject, that the choice of the underlying orientation was perhaps the most difficult problem facing me when MM. Masson & Cie, requested me to write this book. A classification of these works based on their particular orientation and carrying the excess inherent in all that is schematic would lead to the definition of three types of books. Some are handbooks or treatises on "microscopy". They are tacitly limited to the biological applications of the microscope, all of which are reviewed, and include in the same volume the techniques of histology proper along with those of bacteriology, botany and embryology. Such a work, on the scale of an encyclopaedic treatise contributed by specialists from a number of discip lines and meant to be consulted as a dictionary, may have a certain value if it is really exhaustive and periodically revised. But it is no longer possible on the scale of a handbook. A single person, however gifted, cannot have acquired sufficient mastery over all the techniques of the above disciplines to be able to speak from personal experience.

Handbook of Histopathological and Histochemical Techniques (Including Museum Techniques), Third Edition is a reference guide on techniques used in histology and histochemistry, including museum techniques. This book is comprised of 36 chapters divided into six sections. After giving a brief description of the structure and contents of the cell, this book then turns to the various methods of examination of tissue cells and structures, including the smear method, vital staining, and electron microscopy. The next two sections deal with fixation, decalcification, processing, and section cutting, along with stains, impregnations, and mountants. An exhaustive survey of carbohydrate and protein histochemistry is included. Special procedures such as autoradiography, micro-incineration, and injection techniques are described. The remaining chapters focus on the preparation, mounting, and presentation of museum specimens. The book concludes with an analysis of the microscope. This monograph will be invaluable to all those with an interest in histology and histochemistry, including undergraduate students in the biological and health sciences, pathologists in both the hospital setting and experimental research, and technologists and workers in various research fields.
