Nonlinear Control Systems and Power System Dynamics presents a comprehensive description of nonlinear control of electric power systems using nonlinear control theory, which is developed by the differential geometric approach and nonlinear robust control method. This book explains in detail the concepts, theorems and algorithms in nonlinear control theory, illustrated by step-by-step examples.

Nonlinear systems are defined by those, which do not follow the principle of superposition. Nonlinearities in process variables can be caused by stiction in control valves, which, in turn, sets up oscillations that propagate throughout the whole plant.

Nonlinear control theory is the area of control theory which deals with systems that are nonlinear, time-variant, or both. Control theory is an interdisciplinary branch of engineering and mathematics that is concerned with the behavior of dynamical systems with inputs, and how to modify the output by changes in the input using feedback, feedforward, or signal filtering. The system to be controlled is called the "plant". One way to make the output of a system follow a desired reference signal is

Abstract. In the previous chapter, the control design principle and algorithm for SISO affine nonlinear systems are elaborated. This type of systems has only one input, i.e. control variable  $u$  and one output  $y(t)$ . As we know, however, multi-machine power systems are large nonlinear ones with multiple inputs and multiple outputs (MIMO).
