This book is an impressive compilation of contributions on the hot topic of cardiac stem cell therapy from leading groups all over the world. In the assembly of chapters, a structured approach is adopted; starting from the clinician's perspective, all developments in both the experimental and clinical research areas are covered. This journey will take the reader from the bench-top to the bedside, with all chapters written by leading authorities in their respective fields, including data still in press with medical journals. So, beyond being excellent as an overall update for scientists in the field of cardiac stem cell therapy, this book will likely prove an indispensable tool for every budding scientist considering a research project within this field.

The dogmas of the quiet past are inadequate to the stormy present. The occasion is piled high with difficulty, and we must rise with the occasion. As our case is new, so we must think anew and act anew. Abraham Lincoln, 1862 When I came across this quote, it made me recall my first participation at an international meeting on bone marrow transplantation, at a time when this was the only term that was used to describe the field. During a particular session there was a presentation on the use of peripheral blood as the sole source of stem cells for transplantation, and a member of the audience rose to state that it was medically unethical to consider such treatment, as it certainly could not contain stem cells. Now nearly twenty years later, peripheral blood is the predominant source of stem cells used for hematopoietic stem cell transplantation. In the same period of time there have been several other dogmatic opinions, which permeate all of medicine, that have come and gone in the field of hematopoietic stem cell transplantation, and will continue to do so with advancements from basic and clinical research. It is within this context that the format of this book was devised. Traditionally reviews on specific topics related to hematopoietic stem cell transplantation reflect the views of a single author or a research group.

Stem cells potentially offer a novel therapeutic platform to treat bone disease. They also help the scientist understand the molecular and cellular aetiology of bone disorders. Gaining knowledge on the nature and application of stem cell sciences is a prerequisite for understanding their potential in treating or preventing bone disorders. Stem Cells and Bone Tissue is designed to address these areas in three sections: Introductory Text and Sources of Stem Cells for Skeletal Tissue Cellular and Molecular Aspects Conditions, Applications, Treatments and Repairs Coverage includes general aspects of stems cells, sources of stems cells, isolation and purification, applications in regeneration, nanoscale topography, myostatin (GDF-8) signalling, c-Jun, Lnk, cell-derived Factor 1/CXCR4, chromatin remodelling, osteoporosis, osteoarthritis, hypophosphatasia, osteopetrosis, osteogenesis, and many other areas of merit too numerous to mention.

Significance of Stem Cells to Tumor Development Cancer stem cells remain a controversial topic and the criteria that define cancer stem cells are continuing to evolve. A recent surge in stem cell research has ignited a field of discovery into many human diseases including diabetes, neuropathologies, and cancer. By replacing specific differentiated cells that have either been lost or died, stem cell therapy proves to be a very promising approach to the treatment of many debilitating diseases. Though stem cells may provide therapeutic benefit under certain conditions, they are also often implicated in the initiation, progression, and

therapeutic resistance of malignant disease. This first edition of *Stem Cells and Cancer* is intended to give a current perspective on the role of stem cells in cancer and strategies for novel therapies directed toward tumor stem cells. The current cancer stem cell hypothesis is presented in several chapters with distinctions made between the hierarchical and stochastic models of tumor cell development. "Stemness," self-renewal, pluripotency, clonality, and tumorigenicity are important concepts applied towards defining cancer stem cells. Signaling pathways such as Wnt, Sonic Hedgehog, Notch, and Bmi-1 that are involved in differentiation, proliferation, and survival are implicated in the malignant process. Additional chapters address the identification of cancer stem cell populations through the evaluation of molecular markers such as CD133, CD44, and CD24, for example, or by Hoechst dye exclusion to recognize 'side populations.' Mesenchymal and hematopoietic stem cells are described as well as mouse models that are employed to elucidate the properties and functionality of stem cells in cancer and the stem cell niche. This book encompasses a wide variety of human cancers that include but are not limited to leukemia, gliomas, breast, and prostate cancers. Resistance to conventional therapies, genetic versus epigenetic changes that affect therapeutic response and strategies to prevent disease recurrence are challenges have been incorporated into this volume. *Stem Cells and Cancer* represents a compendium of cutting edge research by experts in the field and will be instrumental in the study of this intriguing line of investigation for many years to come. Rebecca Bagley is a senior scientist at Genzyme Corporation and has worked in the biotechnology industry for 20 years with degrees in biology from Wellesley College and Harvard University. Her expertise in drug development spans a wide range of approaches including immunotherapies, gene and protein therapies, and small molecule delivery with publications in journals such as *Molecular Cancer Therapeutics*, *Cancer Research*, and *Microvascular Research*. Her current research focuses on stem cells, tumor vasculature, and target validation. Dr. Beverly A. Teicher is Vice President of Oncology Research at Genzyme Corporation. Dr. Teicher completed a PhD in Bioorganic Chemistry at the Johns Hopkins University and postdoctoral training at Yale University School of Medicine. Dr. Teicher joined Dana-Farber Cancer Institute as an Assistant Professor of Pathology and rose to Associate Professor of Medicine and Radiation Therapy, Harvard Medical School at Dana-Farber Cancer Institute and Joint Center for Radiation Therapy. Dr. Teicher is an active member of the international scientific community having authored or co-authored more than 400 scientific publications. She has edited eight books, is senior editor for the journal *Clinical Cancer Research* and is series editor for the *Cancer Drug Discovery and Development* book series.

Interest in the use of stem cells in aesthetic procedures has been increasing rapidly, reflecting the widespread acknowledgment of the tremendous potential of stem cell fat transfer. This is, however, the first book to be devoted entirely to the subject. The book opens by reviewing the history of the development of pluripotent stem cells and the results of research into the biochemistry and physiology of stem cells. Adipose tissue anatomy and survival are discussed and the wide range of aesthetic procedures involving stem cell fat transfer are then described in detail. These procedures relate to the face, breast, buttocks, legs, hands, penis and Poland syndrome. In addition, potential risks and complications are identified. The book has been written by leading experts and will be an invaluable source of information for students, beginners and experienced surgeons in a range of specialties.

Focused on stem cell applications, this book bridges the fields of biomaterials, offering new insights into constructing and regenerating tissues and organs. Its unique feature is linking diseases of the human body to current thinking on how to deal with them in the context of current concepts and technologies by means of an in-depth focus on biomaterials. The book assembles recent advances and covers a range of topics related to stem cell biology, biomaterials and technological approaches such as bioreactors written by top researchers in the field. Stem cells of both embryonic and adult origin are discussed with applications ranging, but not limited to, nerve regeneration, liver, pancreas, skin, trachea, cartilage and bone repair and cardiovascular therapy. Developments in the field reflecting the design and construction of the human body and its principal anatomy are discussed from a materials point of view. The book will be a valuable tool for biomaterial scientists, tissue engineers, clinicians as well as stem cell biologists involved in basic research and applications of adult and embryonic stem cells. It will also be a

source of reference for students in biotechnology, biomedical engineering, biology, biochemistry, materials sciences, pharmaceuticals, and veterinary and human medicine.

Over the last fifty years, there has been an increasing recognition that eucalypts are vulnerable to a wide range of diseases. They have suffered destructive epidemics, particularly of dieback caused by the cinnamon fungus in native forests, of foliar diseases and cankers in plantations, and of dieback of remnant trees on agricultural and grazing land. This has stimulated intensive research into the causes and management of diseases of the eucalypts. This work represents a comprehensive review of our current knowledge of the health and diseases of eucalypts.
