The Imitation of Gestures describes the sets of tests of the imitation of gestures in children performed by the examiner. These tests provide valuable information about the development of motor skills, particularly the right-left orientation in children from 4 to 8 years of age. This book is composed of two main sections encompassing 9 chapters.

This book is composed of two main sections encompassing 9 chapters.

*The Imitation of Gestures - 1st Edition*

Abstract The view that the motor program activated during imitation is organized by goals was investigated by asking pre-school children to imitate a set of hand gestures of varying complexity that were made by an experimenter sitting in front of them.

*Imitation of Gestures in Children is Goal-directed ...*

Impaired imitation of gestures is one of the deficits that characterises ideomotor apraxia, yet performance of gestures by verbal command may be unaffected, and vice versa. 5 In addition, gestures can be categorised as either meaningless non-symbolic or semantic/symbolic gestures. Goldenberg et al 6

*Impaired imitation of gestures in mild dementia ...*

The imitation of meaningful and meaningless gestures is processed in different ways. The meaningful actions access conceptual knowledge (action semantic system) and stored movement representations (engrams), whereas the meaningless gestures function through another route and bypass both action semantics and engrams [ 27 ].

Psychologist Kenneth Kaye showed that infants' ability to match the sounds or gestures of an adult depends on an interactive process of turn-taking over many successive trials, in which adults' instinctive behavior plays as great a role as that of the infant. These writers assume that evolution would have selected imitative abilities as fit because those who were good at it had a wider arsenal of learned behavior at their disposal, including tool-making and language.

*Imitation - Wikipedia*

As the im- aging study included an imitation task, only video clips of gestures without head and/or shoulder movements were included in order to prevent movement artefacts during the scanner sessions. In all three conditions the same number of gestures was performed with one or both arms and hands.

*Differential role of the Mentalizing and the Mirror Neuron ...*

Imitation of gestures is held to be the most direct test of the integrity of the executorial stage 3, 19. As the examiner provides a model of the intended movement there is no need to evoke the shape of the movement from long-term memory. Hence, failure on this task could only arise from a defect at the executorial stage.

On this assumption we can predict that the imitation of sound gestures, early in infancy, may represent an essential source for learning and socio-emotional communicative skills. Inspired by the procedure and results, we have designed musical tools likely to elicit synchronic imitation of musical gestures (Filippa et al., 2020).

*Frontiers | Shall We Play the Same? Pedagogical ...*

Such imitation implies that human neonates can equate their own unseen behaviors with gestures they see others perform. Infants between 12 and 21 days of age can imitate both facial and manual gestures; this behavior cannot be explained in terms of either conditioning or innate releasing mechanisms.

*[PDF] Imitation of Facial and Manual Gestures by Human ...*

Because of the close coupling between language and manual gestures (Gentilucci & Corballis, 2006), it is possible that verbs coupled to manual gestures might be learned better through imitation than verbs coupled to non-manual gestures, as is the case for the locomotion verbs. Furthermore, while both object-manipulation and locomotion verbs can be goal-directed, locomotion verbs do not always denote intentional goal-directed activities (e.g., to stroll).

*Effects of imitating gestures during encoding or during ...*

Neonatal imitation has been at the centre of much controversy over the past 35 years. Indeed, there has been considerable debate about the potential mechanisms and functions of neonatal imitation. The present study investigates an alternative function of the phenomenon that has not been discussed in the literature to date: that the imitation of oral gestures by newborns serves to facilitate breastfeeding.
